Prarambha 2025

A Mini Hackathon Powered by Google AI Campus Reps

Date: 30th August 2025

Venue: AIDS Labs L1–L6, DKTE

Organized by DSSA Club

About the Themes

These problem statements are designed to inspire participants to tackle real-world challenges using technology, innovation, and creativity. Each theme is crafted to address specific domains while encouraging interdisciplinary solutions. Participants can align their ideas with any of these tracks to build impactful projects.

Health & Medicine This problem statement addresses the growing demand for accessible, efficient, and technology-driven healthcare. It involves tackling challenges in areas such as patient care, medical data management, and health monitoring. Modern healthcare systems face issues of affordability, inequality in access, delayed diagnoses, and overburdened infrastructure. The aim here is to apply digital tools to bridge these gaps, whether by improving the flow of information between patients and providers, enhancing the accuracy of diagnoses, or enabling preventive care. The focus extends beyond hospitals, covering aspects of mental health, wellness, chronic disease management, and even emergency response. At its core, this theme seeks solutions that empower individuals to take charge of their health while enabling healthcare professionals to deliver higher-quality care.

Safety, Security & Accessibility This problem statement focuses on ensuring that individuals feel safe and included in both physical and digital environments. In the modern era, threats are not limited to physical risks such as accidents or emergencies but also extend to digital vulnerabilities like identity theft, cyberattacks, and online abuse. Additionally, accessibility challenges remain for people with disabilities, where technology often overlooks inclusivity. The aim is to build systems that protect people from harm, safeguard their data, and guarantee that technology is usable by everyone regardless of their limitations. It emphasizes resilience, trust, and equity — ensuring that individuals can navigate both the physical and virtual world securely and without barriers.

shield Safety, Security & Accessibility This problem statement centers around the academic, social, and personal aspects of student life. Students often face stress from balancing studies, extracurriculars, and personal well-being while also striving for effective collaboration and engagement within their campus communities. Traditional educational tools may not always support the evolving needs of students in the digital age, where attention spans, learning styles, and access to resources vary widely. The theme focuses on rethinking how technology can support learning, boost motivation, enhance communication between students and institutions, and help with overall personal growth. The broader aim is to create ecosystems that make education not only about acquiring knowledge but also about building experiences that nurture development, confidence, and lifelong skills.

Impact & Sustainability This problem statement emphasizes the urgent need to balance human progress with environmental preservation and social responsibility. The world is facing critical challenges such as climate change, pollution, overuse of natural resources, and unequal access to basic necessities. The theme encourages the development of solutions that minimize ecological footprints, encourage conscious use of resources, and foster fairness in communities. It is not only about solving today's problems but also about safeguarding the planet and its people for future generations. The scope spans ecological, economic, and social dimensions — calling for innovations that promote resilience, inclusivity, and long-term stability. Sustainability here is understood as a holistic responsibility that integrates technology with ethics and accountability.

Future Tech & Innovation This problem statement challenges participants to think ahead and experiment with the frontier of technological advancement. It emphasizes curiosity, creativity, and the drive to explore what technology might look like in the near or distant future. Unlike other themes that focus on current issues, this one is about anticipating future needs, possibilities, and opportunities. It encourages exploration in areas that may not yet be mainstream, such as next-generation AI, augmented reality, quantum computing, or new models of human–machine interaction. The purpose is to go beyond incremental improvements and instead imagine transformative changes — ideas that may redefine industries, societies, or even daily human experiences. The theme values boldness, originality, and vision, where the goal is not just to solve but to reimagine.
